10-29 第二篇

Finding Alternatives to Plastic

Plastic has changed our lives. It is cheap, strong, and easy to shape, so it appears in everything from packaging to phones to medical equipment. But plastic waste has become a serious problem. It pollutes oceans, harms wildlife, and can take hundreds of years to break down. Finding alternatives to plastic is one of the most important challenges of our time. [1] Replacing plastic where possible and using it more wisely where it cannot be replaced is a goal that requires both innovation and changes in how we produce, use, and dispose of materials.

Some alternatives are already in use. Paper and cardboard can replace plastic in many types of packaging. Reusable bags made of cotton or other fabrics have become common in supermarkets. Restaurants are offering bamboo straws and wooden cutlery instead of single-use plastic. [2] These options are not perfect—paper uses trees, and reusable items must be washed—but they can significantly reduce the amount of plastic we throw away each day.

Scientists are developing new materials that might replace plastic in the future. Some are made from plant matter, such as corn or seaweed, and can break down naturally. Others are designed to be recycled more easily. Researchers are also working on ways to break down existing plastic using bacteria or enzymes. [3] Innovation in materials science offers hope that we can find solutions that work for both people and the planet, though turning lab ideas into everyday products takes time and investment.

Governments and businesses have a role to play. Bans on single-use plastic bags and straws are already in place in many countries. Some companies are redesigning products to use less plastic or to make packaging fully recyclable. Consumers can also make a difference by choosing products with less packaging and by reusing and recycling whenever possible. [4] Reducing plastic waste requires action at every level—from individuals making daily choices to governments setting policies and companies changing how they design and sell products.

There is no single solution to the plastic problem. Different situations call for different approaches: sometimes reuse is best, sometimes alternative materials work better, and sometimes reducing consumption is the most effective step. [5] The path forward will depend on continued research, smarter policies, and a shared commitment to protecting our environment for future generations.

选项

A. Replacing plastic where possible and using it more wisely where it cannot be replaced is a goal that requires both innovation and changes in how we produce, use, and dispose of materials. B. These options are not perfect—paper uses trees, and reusable items must be washed—but they can significantly reduce the amount of plastic we throw away each day. C. Innovation in materials science offers hope that we can find solutions that work for both people and the planet, though turning lab ideas into everyday products takes time and investment. D. Reducing plastic waste requires action at every level—from individuals making daily choices to governments setting policies and companies changing how they design and sell products. E. The path forward will depend on continued research, smarter policies, and a shared commitment to protecting our environment for future generations. F. For example, some companies now make water bottles from plant-based materials that can decompose in industrial compost facilities.

答案键（Answer Key）

[1] A [2] B [3] C [4] D [5] E

深度解析

- **[1] A**：
  - **线索**：空前说塑料普及与塑料污染问题，提出寻找替代品的挑战，空后需概括替代策略与要求。A的"Replacing plastic where possible and using it more wisely where it cannot be replaced"与"alternatives"呼应，"requires both innovation and changes"与"challenge"对应，定义应对塑料问题的总体方向。
- **[2] B**：
  - **线索**：空前列举现有替代品——纸、纸板、布袋、竹吸管、木制餐具，空后需评价这些选择的利弊。B的"These options are not perfect—paper uses trees, and reusable items must be washed"承接前文具体替代品，"but they can significantly reduce"与"alternatives are already in use"形成转折与肯定。
- **[3] C**：
  - **线索**：空前说科学家研发植物基材料、易回收材料、生物降解塑料的技术，空后需总结科研创新的希望与局限。C的"Innovation in materials science offers hope"与"Scientists are developing"呼应，"solutions that work for both people and the planet"与"break down naturally、recycled"对应，"turning lab ideas into everyday products takes time"是合理补充。
- **[4] D**：
  - **线索**：空前说政府限塑、企业 redesign、消费者选择，空后需总结多层次行动。D的"Reducing plastic waste requires action at every level"与前文政府、企业、消

费者对应，"from individuals... to governments... and companies"与空前列举完全匹配，逻辑完整。

- **[5] E**：
  - **线索**：空前说无单一解法，不同情境需不同策略，空后需展望未来路径。E的"The path forward will depend on continued research, smarter policies, and a shared commitment"与"no single solution、different approaches"呼应，"protecting our environment for future generations"是全文收尾的合理升华。
- **干扰项分析**：
  - **F. For example, some companies now make water bottles from plant-based materials that can decompose in industrial compost facilities.**：以For example开头，为具体产品举例（植物基水瓶）。各空均为概括或过渡句；[3]虽涉及新材料，但需的是"科研创新希望与局限"的概括，而非单一企业产品案例。
