04-06 第一篇

The Mystery of Deja Vu

Have you ever walked into a room and felt as if you had been there before? Or met someone new and had the strange sense that you already knew them? This puzzling experience is called deja vu, a French phrase meaning "already seen." [1] It usually lasts only a few seconds, but during that moment, the feeling can be surprisingly strong. Scientists estimate that about two-thirds of people experience deja vu at least once in their lives, though it is more common among young adults.

What causes this odd feeling? Researchers have offered several explanations. One theory suggests that deja vu happens when one side of the brain receives information a split second before the other. [2] This tiny delay might make the brain think it is experiencing something for the second time when it is actually the first. Another idea links deja vu to memory. Sometimes a new place or situation may remind us of something from the past without us clearly remembering it. When that happens, we might mistake the vague familiarity for a repeated experience.

Scientists have also studied the brain to find clues. [3] The temporal lobe, which helps us form and recall memories, seems to play an important role. When this part of the brain has a brief mix-up—for example, storing a new moment as if it were an old memory—we may feel that we have lived this moment before. Stress, tiredness, or lack of sleep can make these mix-ups more likely to occur.

Certain situations seem to trigger deja vu more often. [4] Traveling to new places, being in a busy or stressful environment, or simply feeling tired can increase the chance of experiencing it. Some people report having deja vu when they are sick or under a lot of pressure. Though the exact cause remains unclear, it does not usually indicate any health problem.

[5] So the next time you feel that strange sense of "I have been here before," remember that it is a normal and harmless quirk of the human brain. Scientists are still working to fully understand it, but for now, we can simply enjoy the mystery.

选项

A. In other words, the brain may confuse "new" with "already known" because of a timing glitch. B. Most of the time, deja vu is nothing to worry about. C. The experience is brief but memorable for those who have it. D. Research points to a specific area of the brain that deals with memory. E. Deja vu has also been linked to dreams and imagination in some studies. F. These include being in unfamiliar surroundings or when the mind is not fully rested.

答案键（Answer Key）

[1] C [2] A [3] D [4] F [5] B

深度解析

- **[1] C**：
  - **线索**：特征补充与语义衔接。空前定义"deja vu"并举例感受，空后描述"It usually lasts only a few seconds, but during that moment, the feeling can be surprisingly strong"。C选项"The experience is brief but memorable for those who have it"（这种体验短暂但对经历过的人来说令人难忘）中"brief"与空后"only a few seconds"呼应，"memorable"与"surprisingly strong"对应，自然过渡到对时长的具体说明。
- **[2] A**：
  - **线索**：理论解释与因果承接。空前提出"one side of the brain receives information a split second before the other"，空后"This tiny delay might make the brain think it is experiencing something for the second time when it is actually the first"。A选项"In other words, the brain may confuse 'new' with 'already known' because of a timing glitch"（换句话说，由于时间上的小差错，大脑可能把"新的"误认为"已知的"）用"In other words"概括前文理论，"timing glitch"对应"split second...before the other"，"confuse new with already known"与空后"think it is experiencing...for the second time...actually the first"同义，衔接紧密。
- **[3] D**：
  - **线索**：科学发现与具体展开。空前总述"Scientists have also studied the brain to find clues"，空后"The temporal lobe, which helps us form and recall memories, seems to play an important role"。D选项"Research points to a specific area of the brain that deals with memory"（研究指向大脑中负责记忆的特定区域）中"specific area"自然引出空后"the temporal lobe"的具体命名，"deals with memory"与"form and recall memories"呼应，逻辑顺畅。
- **[4] F**：
  - **线索**：情境列举与语义对应。空前指出"Certain situations seem to trigger deja vu more often"，空后列举"Traveling to new places, being in a busy or stressful environment, or simply feeling tired"。F选项"These include being in unfamiliar surroundings or when the mind is not fully rested"（这些包括处于陌生环境或头脑未充分休息时）中"These"指代"situations"，"unfamiliar surroundings"对应"new places...busy or stressful environment"，"not fully rested"对应"feeling tired"，完美衔接。

- [5] B：
    - **线索**：全文收束与安抚提醒。空[5]位于结尾段段首，空后"So the next time...remember that it is a normal and harmless quirk...nothing to worry about"等表述。B选项"Most of the time, deja vu is nothing to worry about"（大多数时候，似曾相识感无需担心）点明主旨，与空后"normal and harmless"形成呼应，为结尾的总结与安慰定下基调。
- **干扰项分析**：
    - **E. Deja vu has also been linked to dreams and imagination in some studies.**：提及梦境与想象，与记忆、大脑机制相关，看似可填[3]或[4]。但空[3]前文聚焦"temporal lobe...form and recall memories"，需的是与记忆区域直接相关的科学发现，E的"dreams and imagination"与前文"stress, tiredness"等诱因不在同一逻辑链；空[4]需的是触发情境的列举，E为另一种理论方向，无法与空后"Traveling to new places...feeling tired"并列。属"主题相关但逻辑角色不符"型干扰。
