06-18 第二篇

Glaciers and Global Warming

Glaciers are huge masses of ice that form in cold mountain areas or near the poles. They move slowly downhill, carving valleys and shaping the land over thousands of years. Glaciers store about three-quarters of the world's fresh water and are sometimes called "water towers" because they provide water for rivers and lakes in many regions. [1] In other words, glaciers are vital for both the landscape and the water supply of millions of people. Yet today, glaciers are melting at a speed that worries scientists around the world.

The main cause of glacier melt is rising temperatures. [2] As the Earth warms because of greenhouse gases—such as carbon dioxide from burning coal and petrol—snow and ice melt faster than they can be replaced. In summer, glaciers naturally lose some ice, but in winter new snow usually adds it back. When winters become warmer and shorter, and summers become hotter, the balance is broken. More ice melts than forms each year, so glaciers shrink. Scientists measure this change using satellites and on-the-ground studies to track how fast glaciers are retreating.

Melting glaciers bring serious problems. [3] First, they can cause floods when meltwater suddenly fills rivers or when ice blocks give way. Second, as glaciers shrink, many rivers that rely on them will have less water in the dry season, which can affect farming and drinking water for millions. Third, when glaciers melt into the ocean, they add to sea-level rise, putting coastal cities at risk. These effects touch people far from the mountains—anyone who depends on rivers fed by glaciers or lives near the sea may feel the impact.

What can we do? [4] Reducing greenhouse gas emissions is the most important step. This means using less fossil fuel, switching to renewable energy like wind and solar, and making our cars, buildings, and factories more efficient. Governments, businesses, and individuals all have a role to play. Some countries have set targets to cut emissions and protect glacier regions. While we cannot stop melting overnight, taking action now can slow it down and help communities adapt to changes that are already happening.

[5] Glaciers are a precious resource and a sign of the health of our planet. By understanding how they are changing and why, we can take responsibility for our impact on the Earth. The choices we make today about energy and the environment will shape the future of glaciers—and the millions of people who depend on them.

选项

A. In other words, glaciers are vital for the landscape and for the water supply of many people. B. That is because warmer temperatures cause more ice to melt each year than can be replaced by new snow. C. In fact, melting glaciers lead to floods, water shortages, and sea-level rise in many regions. D. These actions include cutting emissions, using clean energy, and making our systems more efficient. E. In short, glaciers are precious and our choices about the environment will shape their future. F. For example, the Alps in Europe have many famous glaciers that attract tourists each year.

答案键（Answer Key）

[1] A [2] B [3] C [4] D [5] E

深度解析

- **[1] A**：
  - **线索**：概括冰川对景观与水源的重要性。空前描述"Glaciers huge masses of ice...form in cold mountain areas or near poles...move slowly...carving valleys, shaping land...store about three-quarters world's fresh water...'water towers'...provide water for rivers and lakes in many regions"，空后说明"glaciers are vital for both the landscape and the water supply of millions of people...Yet today...melting at speed that worries scientists"。A选项"In other words, glaciers are vital for the landscape and for the water supply of many people"（换言之，冰川对景观和许多人的水源至关重要）中"In other words"概括空前，"vital for landscape...water supply"与空后"vital for...landscape and...water supply"精准呼应，衔接顺畅。
- **[2] B**：
  - **线索**：冰川融化的成因——升温导致收支失衡。空前提出"The main cause of glacier melt is rising temperatures"，空后详述"Earth warms because of greenhouse gases...carbon dioxide from coal, petrol...snow and ice melt faster than replaced...summer naturally lose some ice, winter new snow adds back...winters warmer and shorter, summers hotter...balance broken...more ice melts than forms...glaciers shrink...scientists measure with satellites, on-the-ground studies"。B选项"That is because warmer temperatures cause more ice to melt each year than can be replaced by new snow"（那是因为气温升高导致每年融化的冰多于新雪所能补充）中"That is because"解释原因，"warmer temperatures...more melt than replaced"与空后 balance broken、more melts than forms 完美对应，逻辑紧密。
- **[3] C**：

- **线索**：冰川融化带来的多重危害。空前提出"Melting glaciers bring serious problems"，空后列举"First...floods when meltwater fills rivers or ice blocks give way...Second...glaciers shrink...rivers less water dry season...affect farming, drinking water...Third...melt into ocean...sea-level rise...coastal cities at risk...effects touch people far from mountains...anyone who depends on glacier-fed rivers or lives near sea"。C选项"In fact, melting glaciers lead to floods, water shortages, and sea-level rise in many regions"（事实上，冰川融化在许多地区导致洪水、水资源短缺及海平面上升）中"In fact"强化危害，"floods, water shortages, sea-level rise"与空后 floods、less water、sea-level rise 精准对应，衔接自然。

- **[4] D**：
  - **线索**：应对措施——减排与清洁能源。空前提出"What can we do?"，空后描述"Reducing greenhouse gas emissions most important...use less fossil fuel...switch to renewable...wind, solar...cars, buildings, factories more efficient...governments, businesses, individuals...some countries set targets...cut emissions, protect glacier regions...action now can slow, help adapt"。D选项"These actions include cutting emissions, using clean energy, and making our systems more efficient"（这些行动包括减排、使用清洁能源以及提高系统效率）中"These actions"指代空后各项措施，"cutting emissions, clean energy, more efficient"与空后 reducing emissions、renewable、efficient 完美对应，衔接得当。

- **[5] E**：
  - **线索**：全文收束与责任与未来。空[5]位于结尾段段首，空后总结"Glaciers precious resource, sign of planet's health...understanding how changing and why...take responsibility for impact...choices we make today about energy and environment...shape future of glaciers and millions who depend on them"。E选项"In short, glaciers are precious and our choices about the environment will shape their future"（简言之，冰川很宝贵，我们对环境的选择将塑造它们的未来）用"In short"总结全文，"precious...choices...shape their future"与空后"precious...choices...shape the future"形成呼应，收束精准。

- **干扰项分析**：
  - **F. For example, the Alps in Europe have many famous glaciers that attract tourists each year.**：涉及阿尔卑斯冰川旅游，易被误填[1]或[3]。但F以"For example"引出单一地标，而空[1]讨论的是冰川对景观与水源的普遍重要性，F的"Alps...tourists"属于旅游价值，与"landscape and water supply"的生态与水源焦点不同；空[3]讨论融化带来的问题，F的"attract tourists"与 floods、water shortages、sea-level rise 无直接关联。F属"主题相关但论述层次错位"型干扰。
