Next, we tested the glass cup and the wooden stick. ***5*** of them could make the bulb light up. Finally, we tried the iron key, and the bulb became bright again. We ***6*** that metals can conduct electricity, but plastic, glass, and wood cannot.

After the experiment, each group shared their ***7*** with the class. Our teacher was pleased and said we had done a wonderful job. She explained that understanding which materials conduct electricity is very ***8*** in daily life. It helps us stay safe around electrical things.

I really enjoyed this experiment. It was much more interesting than just ***9*** a textbook. I hope we can do more hands-on experiments like this. Learning by doing is the best ***10*** to understand science.
