08-12 第1篇

阅读理解（说明文）

① Typhoons (台风) are powerful storms that form over warm ocean waters, usually in summer and autumn. When the sun heats the sea surface (海面), warm air rises quickly and creates areas of low pressure (低压). Cool air rushes in to fill the space, and with the Earth's rotation (自转), these winds begin to spin in a circular pattern. When wind speeds reach over 119 kilometers per hour, the storm is called a typhoon.

② A typhoon has three main parts: the eye, the eye wall, and the rain bands. The eye is the calm center of the storm — the sky may even be clear there. But the eye wall around it has the strongest winds and the heaviest rain. The rain bands are the clouds and rain that spiral (盘旋) outward from the center. These bands can stretch for hundreds of kilometers and bring heavy rainfall to coastal cities.

③ Typhoons often cause serious damage. Strong winds can knock down trees and destroy buildings. Heavy rain leads to floods (洪水) in low-lying areas. Storm surges (风暴潮) — when seawater is pushed onto the shore — can sweep away cars and damage coastal roads. In China, provinces like Guangdong, Fujian, and Zhejiang are most often affected because they lie along the coast.

④ To stay safe during a typhoon, people should follow official warnings. Listen to the radio or TV for the latest information. Store enough food, water, and medicine at home. Close all windows and doors tightly. If you live near the sea or in a low area, move to a higher and safer place before the typhoon arrives. Do not go outside during the storm — flying objects can cause serious injuries.

⑤ Understanding typhoons helps us prepare better and reduce harm. Schools sometimes close when a typhoon is coming, and families should have an emergency plan (应急预案) ready. Remember: being prepared is the best way to protect yourself and your loved ones.
