# 06-16 第二篇

**How the Eye Works**

The human eye is a wonderful organ that allows us to see the world in colour and detail. It works like a camera: light enters through the front, passes through several parts, and finally forms an image at the back. [1] In other words, the eye is a complex system that turns light into the pictures we "see" in our brain. Understanding how the eye works helps us appreciate the gift of sight and reminds us to take good care of our eyes.

When light enters the eye, it first passes through the cornea（角膜）—a clear, curved layer at the front that helps focus the light. [2] Then it travels through the pupil, the black circle in the middle of the eye, which grows larger in dim light and smaller in bright light to control how much light enters. Behind the pupil is the lens, which further focuses the light onto the retina（视网膜）at the back of the eye. The lens can change shape to focus on objects both near and far—a process called accommodation（调节）.

The retina is where the real "seeing" happens. [3] It contains millions of cells called rods and cones: rods help us see in low light and detect movement, while cones allow us to see colours and fine details in bright light. These cells turn light into electrical signals that travel along the optic nerve to the brain. The brain then interprets these signals and creates the image we perceive. Without the retina and its cells, we would not be able to see at all.

Many people have vision problems. [4] Some are short-sighted and cannot see distant objects clearly; others are long-sighted and have trouble seeing things up close. These conditions can often be corrected with glasses or contact lenses. Spending too much time on screens, reading in poor light, or not wearing protective glasses when needed can strain the eyes. Regular eye checks and good habits—such as resting the eyes and spending time outdoors—can help keep our vision healthy for life.

[5] Our eyes are precious and deserve our care. By understanding how they work and taking steps to protect them, we can enjoy clear sight for years to come. Remember to rest your eyes, wear sunglasses in bright sunshine, and see an eye doctor if you notice any changes in your vision.

## 选项

A. In other words, the eye is a complex system that turns light into images we perceive in our mind. B. The pupil then adjusts its size to control the amount of light that enters, and the lens focuses it onto the retina. C. In fact, the retina has rods and cones that turn light into signals the brain uses to form what we see. D. These problems show that vision issues are common but can often be improved with proper care. E. In short, our eyes are

precious and we should take good care of them for a lifetime of clear sight. F. For example, the cornea is the part of the eye that helps focus incoming light.

## 答案键（Answer Key）

[1] A [2] B [3] C [4] D [5] E

## 深度解析

- **[1] A**：
  - **线索**：概括眼睛的工作原理与成像本质。空前描述"Human eye wonderful organ...see world in colour and detail...works like camera: light enters...passes through several parts...forms image at back"，空后说明"eye is complex system that turns light into pictures we 'see' in our brain...Understanding helps appreciate gift of sight...care for eyes"。A选项"In other words, the eye is a complex system that turns light into images we perceive in our mind"（换言之，眼睛是将光线转化为我们在脑中感知到的图像的复杂系统）中"In other words"概括空前比喻，"complex system...turns light into images...perceive in mind"与空后"complex system...turns light into pictures...in our brain"精准呼应，衔接顺畅。
- **[2] B**：
  - **线索**：光线经瞳孔与晶状体到达视网膜的过程。空前描述"Light enters...first passes through cornea...clear, curved layer...helps focus"，空后详述"travels through pupil, black circle...grows larger in dim light, smaller in bright light to control...Behind pupil is lens...further focuses onto retina...lens can change shape...accommodation"。B选项"The pupil then adjusts its size to control the amount of light that enters, and the lens focuses it onto the retina"（接着瞳孔调整大小以控制进入的光量，晶状体将其聚焦到视网膜上）中"The pupil then"承接角膜之后，"adjusts size...control light...lens focuses onto retina"与空后 pupil、grows larger/smaller、lens、retina 完美对应，逻辑紧密。
- **[3] C**：
  - **线索**：视网膜上的感光细胞及其功能。空前提出"The retina is where the real 'seeing' happens"，空后列举"Contains millions of cells rods and cones...rods help see in low light, detect movement...cones allow see colours, fine details in bright light...turn light into electrical signals...travel along optic nerve to brain...brain interprets...creates image...without retina...would not see"。C选项"In fact, the retina has rods and cones that turn light into signals the brain uses to form what we see"（事实上，视网膜有视杆和视锥细胞，将光转化为大脑用以形成我们所见的信号）中"In fact"强化视网膜功能，"rods and cones...turn

light into signals...brain uses to form what we see"与空后 rods、cones、electrical signals、brain interprets 精准对应，衔接自然。

- **[4] D**：
  - **线索**：常见视力问题及矫正与护眼。空前提出"Many people have vision problems"，空后描述"Short-sighted...long-sighted...corrected with glasses or contact lenses...screen time, poor light, no protective glasses can strain...regular eye checks, good habits...rest eyes, outdoors...keep vision healthy"。D选项"These problems show that vision issues are common but can often be improved with proper care"（这些问题表明视力问题很常见，但往往可通过妥善护理改善）中"These problems"指代空前与空后各类视力问题，"common...improved with proper care"与空后 corrected、regular checks、good habits 完美对应，衔接得当。
- **[5] E**：
  - **线索**：全文收束与护眼倡议。空[5]位于结尾段段首，空后总结"Eyes precious...deserve care...understanding how they work, taking steps to protect...enjoy clear sight for years...rest eyes, wear sunglasses, see eye doctor if changes"。E选项"In short, our eyes are precious and we should take good care of them for a lifetime of clear sight"（简言之，我们的眼睛很宝贵，我们应好好呵护以获得一生的清晰视力）用"In short"总结全文，"precious...take good care...lifetime of clear sight"与空后"precious...deserve care...enjoy clear sight for years"形成呼应，收束精准。
- **干扰项分析**：
  - **F. For example, the cornea is the part of the eye that helps focus incoming light.**：涉及角膜聚焦光线，易被误填[2]。但F以"For example"引出角膜这一单一结构，而空[2]讨论的是光线经瞳孔、晶状体到达视网膜的连续过程，空前已提及"cornea...helps focus"，空后主要讲pupil、lens、retina，F仅重复角膜信息，与"pupil...lens...retina"的递进论述不符。F属"局部信息重复、论述层次错位"型干扰。
