07-25 第一篇

The Wonder of Animal Migration

Every year, billions of animals—birds, fish, mammals, and insects—travel thousands of miles across the earth. They fly over oceans, swim through rivers, and walk across continents. This amazing behavior is called migration. Scientists have studied it for decades, yet many mysteries remain. [1] Migration reveals both the toughness of life and the delicate balance of nature. Understanding it helps us protect these incredible travelers and the ecosystems they depend on.

Why do animals migrate? [2] The main reasons are food, weather, and breeding. In winter, many birds fly south to find warmer weather and more food. Salmon swim upstream to lay their eggs in the rivers where they were born. Wildebeests in Africa follow the rains to reach fresh grasslands. Each species has developed its own migration pattern over millions of years. These journeys are essential for survival—without them, many populations would not last.

Migration is full of dangers. [3] Migrating animals face predators, bad weather, and human-made obstacles. Birds can be exhausted by long flights and sometimes crash into buildings or power lines. Fish must pass dams and polluted waters. Some animals cross busy roads and risk being hit by cars. Habitat loss along migration routes makes the journey even harder. Conservation groups work to create safe passages and protect critical stopping points. The challenges are real, but so is the animals' determination.

How do they find their way? [4] Different animals use different methods. Birds may use the sun, stars, Earth's magnetic field, or landmarks to navigate. Salmon are thought to use the smell of their home river. Monarch butterflies, which travel from Canada to Mexico, are born with a built-in sense of direction. Scientists are still learning how these navigation systems work. What is clear is that migration requires remarkable skills that we are only beginning to understand.

Animal migration is one of nature's greatest shows. [5] By protecting migration routes and reducing threats, we can ensure that future generations will witness these extraordinary journeys. Every butterfly, bird, and whale that completes its migration is a triumph of life. Let us do our part to keep these ancient paths open. The survival of countless species—and the health of our planet—depends on it.

选项

A. It shows both the resilience of living things and nature's fragile balance. B. Animals migrate mainly to find resources and suitable conditions for reproduction. C. The journey is risky due to predators, weather, and human activities. D. Various species use different

cues and instincts to navigate. E. We must safeguard these journeys for the sake of wildlife and the planet. F. For example, some birds travel nonstop for several days without eating.

答案键（Answer Key）

[1] A [2] B [3] C [4] D [5] E

深度解析

- **[1] A**：
  - **线索**：空前描述迁徙现象及科学家研究，空后总领"Understanding it helps us protect"，A项"展现了生命的韧性以及自然的脆弱平衡"承上启下，将迁徙奇迹与保护意义衔接，呼应后文保护生态系统。
- **[2] B**：
  - **线索**：本段回答"Why do animals migrate?"，空后列举食物、天气、繁殖（鸟类南飞、鲑鱼洄游、角马追雨等），B项"动物迁徙主要为寻找资源和适宜繁殖条件"准确概括原因。
- **[3] C**：
  - **线索**：本段主题为"Migration is full of dangers"，空后具体描述天敌、恶劣天气、人类设施（建筑、电线、大坝、道路）、栖息地丧失等，C项"旅途因天敌、天气和人类活动而充满风险"全面概括。
- **[4] D**：
  - **线索**：本段回答"How do they find their way?"，空后列举鸟类用太阳/星星/地磁/地标、鲑鱼用气味、帝王蝶用本能等，D项"不同物种使用不同线索与本能导航"概括导航方式多样性。
- **[5] E**：
  - **线索**：结尾段总结并号召，空前总述迁徙为自然奇观，空后"protecting routes""reducing threats""ensure future generations""survival of species"，E项"我们必须为野生动物和地球守护这些旅程"呼应保护主题。
- **干扰项分析**：
  - **F. For example, some birds travel nonstop for several days without eating.**：以 For example 开头，虽与鸟类迁徙相关，但仅为例证细节，无法作为段首概括句，且与 [2][3][4] 各段主题（原因、危险、导航）不匹配，为干扰项。
