11-17 第一篇

Green Buildings: Designing for a Sustainable Future

In recent years, more and more architects and builders have begun to design "green buildings." These structures use less energy, water, and materials than traditional buildings. They often feature solar panels on the roof, large windows for natural light, and special insulation to keep rooms warm in winter and cool in summer. Green buildings not only help the environment but also save money on electricity and water bills over time. [1] The idea behind green building is simple: create spaces where people can live and work comfortably while causing less harm to the planet.

One key feature of green buildings is their focus on energy efficiency. Lights may turn off automatically when no one is in a room. Heating and cooling systems use sensors to adjust the temperature based on real conditions. Some buildings even collect rainwater to use for flushing toilets and watering plants. These designs reduce the need for outside energy sources and lower the building's "carbon footprint"—the total amount of greenhouse gases it produces. [2] Every choice in green building design aims to use resources wisely and minimize waste, from the materials chosen to the way air and water flow through the structure.

Green buildings also pay attention to the materials used in construction. Recycled steel, bamboo flooring, and low-VOC (volatile organic compound) paint are common choices. These materials are easier on the environment because they require less energy to produce or release fewer harmful chemicals. Builders may also use locally sourced materials to cut down on transportation and support nearby businesses. [3] By selecting sustainable materials, green buildings reduce their impact on nature from the very beginning of the building process.

Living or working in a green building can have health benefits too. Better air quality, more natural light, and views of plants or gardens can improve mood and concentration. Studies show that students in green schools often perform better on tests, and workers in green offices report fewer headaches and less fatigue. [4] Green buildings are designed not only to protect the environment but also to support the physical and mental well-being of the people who use them.

Today, many cities and governments encourage or require green building standards for new construction. Rating systems like LEED (Leadership in Energy and Environmental Design) help builders measure how "green" a building is. As more people learn about the benefits of sustainable design, the demand for green buildings continues to grow. [5] The future of architecture is moving toward buildings that are kinder to the earth and better for the people inside them.

选项

A. The idea behind green building is simple: create spaces where people can live and work comfortably while causing less harm to the planet. B. Every choice in green building design aims to use resources wisely and minimize waste, from the materials chosen to the way air and water flow through the structure. C. By selecting sustainable materials, green buildings reduce their impact on nature from the very beginning of the building process. D. Green buildings are designed not only to protect the environment but also to support the physical and mental well-being of the people who use them. E. The future of architecture is moving toward buildings that are kinder to the earth and better for the people inside them. F. For example, the Bank of America Tower in New York uses advanced systems to recycle water and reduce energy use by more than 50 percent.

答案键（Answer Key）

[1] A [2] B [3] C [4] D [5] E

深度解析

- **[1] A**：
  - **线索**：空前介绍绿色建筑的基本概念——节能节水节材、太阳能板、自然采光、保温隔热，以及环保与省钱的双重好处，空后需总结绿色建筑的设计理念。A的"create spaces where people can live and work comfortably"与舒适居住、工作对应，"causing less harm to the planet"概括前文环保效果，是段落的理念总结。
- **[2] B**：
  - **线索**：空前描述绿色建筑在能源效率上的具体做法——自动关灯、温控传感器、雨水收集等，以及降低碳足迹的效果，空后需概括设计思路。B的"Every choice in green building design aims to use resources wisely and minimize waste"与前文各项节能措施呼应，"from the materials chosen to the way air and water flow"自然承接下段材料与资源话题。
- **[3] C**：
  - **线索**：空前列举绿色建筑选材——回收钢材、竹地板、低VOC涂料、本地材料等，强调环保与减排，空后需总结选材的意义。C的"By selecting sustainable materials"与前文材料列举对应，"reduce their impact on nature from the very beginning"概括选材阶段即开始的环保效应。
- **[4] D**：

- **线索**：空前说明绿色建筑对健康的影响——空气质量、自然光、绿景提升情绪与专注，学生成绩更好、员工头痛疲劳减少，空后需点明双重设计目的。D的"not only to protect the environment but also to support the physical and mental well-being"与前文健康研究呼应，是对本段主旨的提炼。

- **[5] E**：
  - **线索**：空前描述政策推动、LEED评分体系及绿色建筑需求增长，空后需展望建筑发展方向。E的"The future of architecture is moving toward"承接全文讨论，"kinder to the earth and better for the people inside them"总结环保与人本双重主题。

- **干扰项分析**：
  - **F. For example, the Bank of America Tower in New York uses advanced systems to recycle water and reduce energy use by more than 50 percent.**：以For example开头，为具体建筑案例（纽约某大厦）。各空均为概括或过渡句；[2]易被误选因涉及节能，但该空需总结设计原则，而非单一建筑的节能案例。
