03-05 第2篇

阅读理解（议论文） Should Middle-School Students Learn Simple Programming?

① A few years ago, writing computer code was seen as something only university students or engineers needed to do. Today, many primary schools already teach block-based programming, and parents often ask a new question: **should middle-school students also spend time learning simple programming?** Both sides of this question have strong voices.

② Those who say "no" often worry about time. Middle-school students already have Chinese, maths, English, physics, and P.E., plus piles of homework every evening. "My son sleeps at 11 p.m.," one father said on a school notice board. "Where can he fit in another subject?" Others worry that children will stare at screens even longer, which is bad for their eyes and their sleep.

③ However, the people who support programming believe these worries miss the point. First, learning to program is really **learning how to think clearly**. When a student writes a small game, she must break a big problem into small steps, check her mistakes, and try again. These thinking habits help with maths, writing, and even daily life — for example, planning a family trip or solving a puzzle with friends.

④ Second, simple programming is more **creative** than many people imagine. With block-based tools like Scratch, a student can build a talking cat, a guessing game, or an animation about her grandmother's hometown. She is not just "using" a phone; she is making something new from an empty screen. This kind of activity turns screen time from passive watching into active creating.

⑤ Third, in a world full of AI chat tools and smart robots, the student who **understands even a little code** can see more clearly how these tools work and where they can go wrong. She knows why an AI sometimes gives a strange answer, and she can talk about the rules that guide it. Without this basic understanding, she will always be a user but never a confident maker.

⑥ Of course, no one is saying that every teenager must become a programmer. Two or three hours a week, guided by a good teacher, can already open the door. Whether a student ends up loving art, medicine, or business, the habit of thinking step by step will stay with her for life. For this reason, I believe middle-school students should learn at least a **simple level** of programming — not to add more pressure, but to add more **clear thinking** to their future.

根据短文内容，选择最佳答案。

1. What question does the passage mainly discuss?

A. How to write a popular mobile game.
B. Whether middle-school students should learn simple programming.
C. Why primary schools should stop teaching coding.
D. How parents should manage their children's pocket money.

2. What do the parents in Paragraph 2 worry about?

A. Programming is too easy for middle-school students.
B. Students do not have time and may stare at screens longer.
C. Only girls are interested in programming.
D. Schools will close other subjects like music.

3. According to the writer, what is the biggest benefit of simple programming?

A. It helps students win gold medals.
B. It makes students better at drawing pictures.
C. It teaches students to think clearly step by step.
D. It helps students earn money online.

4. What does the writer want to show by talking about AI chat tools in Paragraph 5?

A. AI tools are always correct, so we should trust them.
B. AI tools are dangerous and should be banned in schools.
C. Knowing some code helps students understand and judge AI tools.
D. AI tools are too difficult for middle-school students.

5. What is the writer's final opinion?

A. Every teenager must become a professional programmer.
B. Programming should replace P.E. at school.
C. Middle-school students should learn at least a simple level of programming.
D. Programming is only useful if it helps students win exams.

答案与解析

1.
【答案】B
【题型】主旨大意题
【定位】第①段末句 + 全文讨论
【解析】全文围绕"中学生是否应学习简单编程"展开。A、C、D 偏题或无依据。故选 B。

2.
【答案】B
【题型】细节理解题
【定位】第②段第 3 句 + 末句 "Where can he fit in another subject?... stare at screens even longer"
【解析】家长担心时间不够+长时间盯屏。A 项与"too easy"相反；C、D 无依据。故选 B。

3.
【答案】C
【题型】细节理解题
【定位】第③段第 1 句 "learning to program is really learning how to think clearly"
【解析】作者明确指出最大好处是"学会清晰思考"。A、B、D 均非主要论点。故选 C。

4.
【答案】C
【题型】推理判断题
【定位】第⑤段 "understands even a little code... can see more clearly how these tools work and where they can go wrong"
【解析】作者提 AI 工具是为说明懂一点代码的人能看清其工作原理与错误。A 项"永远正确"、B 项"应禁止"均与文意相反；D 项偏离论点。故选 C。

5.
【答案】C
【题型】观点态度题
【定位】第⑥段末句 "middle-school students should learn at least a simple level of programming"
【解析】作者最终结论是中学生至少应学习简单水平的编程。A 项过度推断；B、D 无依据。故选 C。

词汇注释（超纲词）

- **programming** [n.] 编程
- **block-based** [adj.] 积木式的；模块式的
- **Scratch** 一款适合青少年的图形化编程工具
